

ANOOP ANILKUMAR

Senior Software Engineer | Full Stack & Backend | AI Agents & Automation

Kollam, Kerala, India · anoopa413@gmail.com · [linkedin.com/in/anoop-anilkumar-b2185114b](https://www.linkedin.com/in/anoop-anilkumar-b2185114b) · github.com/Anoopanil413

SUMMARY

Software engineer with 4 years building and running production systems end to end — REST APIs and backend services in Node.js and Python, React and Next.js frontends typed against them, LLM-backed automation behind schema-enforced contracts, and containerised deployment onto cloud infrastructure. Comfortable owning a feature from data model through to release, and equally comfortable working out why the live system is slow.

TECHNICAL SKILLS

Languages	JavaScript, TypeScript, Python, SQL
Frontend	React, Next.js, Vue.js, responsive UI architecture, accessibility
Backend	Node.js, Express, Flask, FastAPI, REST API design, microservices, system design
Data	PostgreSQL, MySQL, MongoDB, Redis, schema design, query optimisation, caching
AI & Automation	LLM integration, AI agents, agentic workflows, JSON-schema contracts, workflow automation
Infrastructure	Docker, Kubernetes, CI/CD, GitHub Actions, cloud deployment, Nginx
Practices	API contract design, testing (pytest, Jest), code review, Git, Agile delivery

PROFESSIONAL EXPERIENCE

Full Stack Developer · Dignizant Technologies LLP · Surat, Gujarat Jan 2024 – Present

- Own backend services in Node.js and Python end to end — REST API contracts, data modelling and background job processing for client-facing production systems.
- Build React and Next.js frontends against those services with typed API layers, so a change to a response shape surfaces at compile time rather than in the browser.
- Integrate LLM-backed automation into production workflows with schema-validated agent I/O and explicit boundaries on what the model is permitted to decide.
- Reduce latency on read-heavy endpoints by introducing Redis caching and reworking database access patterns and indexing.
- Containerise services with Docker and carry them through environment configuration, release and cloud deployment.

Full Stack Developer · Richinnovations Technologies Pvt. Ltd. · Trivandrum, Kerala 2023 – 2024

- Delivered multiple client applications end to end, moving between backend APIs and frontend interfaces as each project required.
- Introduced a design-before-code practice — data models, endpoint contracts and service boundaries agreed up front — materially reducing rework.
- Supported and extended live production systems: diagnosed issues under time pressure and added features to existing codebases.
- Translated loose stakeholder requirements into scoped, buildable technical work with realistic delivery boundaries.

MERN Stack Developer · Brototype · Trivandrum, Kerala Jun 2022 – Apr 2023

- Built full-stack MERN applications from scratch — authentication, REST APIs, MongoDB schema design and React frontends — and deployed them to live infrastructure, covering environments, process management and reverse proxy configuration.

SELECTED PROJECTS

Disciple — trading decision-support platform — Python, FastAPI, PostgreSQL, Redis, DuckDB, Expo/React Native

- Architected a system in which deterministic engines compute regime, risk, sizing and expectancy while a separate LLM agent layer explains that output across a one-way, schema-enforced boundary — agents cannot write prices, sizes or plans.
- Enforced correctness at the type level: integer-paise currency, as-of market-data reads that raise on look-ahead, and costs injected into every evaluation; mypy --strict, pytest contract suites and agent evals gated in CI.

Email Marketing Automation — campaign platform — Node.js, React, MongoDB, Redis, Docker

- Built a queued send pipeline paced against provider rate limits with backoff retries, plus webhook ingestion of delivery, open and bounce events reconciled against campaign state.

Doki — Web3 token application — React, TypeScript, Node.js, smart contract integration

- Modelled transaction lifecycle as first-class state — pending, confirmed, reverted — and added an event indexer so read-heavy views do not depend on live node calls.

EDUCATION

[Degree, e.g. B.Tech in Computer Science] · [University / College]
